THE GOOD AND THE BEAUTIFUL LIBRARY

DEFINITIONS

CABOCHON

A stone or gem that has been smoothed and polished, but is not faceted

IRIDESCENT

Creates rainbow-like colors when looked at from different angles

OPAQUE

Light does not pass through it at all

CLARITY

How clear a mineral is or the ability of light to go through it; translucent, transparent, and opaque refer to clarity

TRANSLUCENT

Light goes through it, but is foggy looking

FACETED

A mineral cut to have many sides, increasing its apparent luster

MOHS SCALE

Rates the hardness of a rock or mineral

TRANSPARENT

See-through, like a clean window

PYRITE

This lustrous metallic mineral is nicknamed “fool’s gold.” You can see why! Pyrite is used in a number of modern industries, including jewelry, paper production, and solar panels. It gets its name from the Greek word “pyr,” which means fire, because it sparks when struck by metal.

FACTS

TYPE: Mineral

MOHS SCALE: 6–6.5

LUSTER:

- Metallic

ROCK STUDY

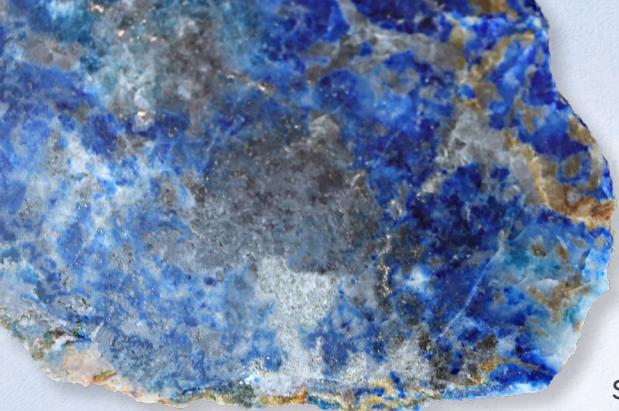

Do you think you could be fooled to think it is gold? Here's how to tell the difference: Pyrite is hard and brittle, and gold is soft and bendable. Pyrite usually forms in cubes or crystals, and gold forms in random shapes. Pyrite often has striations, or visible lines, on it; gold does not. Can you see the difference?

Pyrite
striations

LAZURITE

This semi-precious stone is mined mostly in Afghanistan. Bright blue in color, it usually has stripes of minerals running through it, such as pyrite and calcite (which is white). In historical times, it was ground into a powder and added to oil to make paint—an extremely rare and expensive blue paint. The stone is often used to make jewelry.

ROCK STUDY

Doesn't the beautiful round lapis lazuli (lazurite mixed with other minerals) resemble the earth, complete with calcite clouds and pyrite islands? Look closely at all the specimens pictured: the sparkle of the gold pyrite, the darker blue inclusions, the white calcite. Do you think lapis lazuli would be as beautiful without all those "imperfections"?

FACTS

TYPE: Metamorphic

MOHS SCALE: 5–5.5

LUSTER:

- Dull
- Vitreous
- Greasy
- Waxy

Jade refers to two different minerals that are very similar in hardness and appearance: jadeite and nephrite. Jadeite is slightly harder and more valuable. The more iron present in jade, the deeper the green. Jade can also be found in different colors: white, pink, lavender, and even black. The color depends upon the elements present, such as iron and chromium.

Black Jade

ROCK STUDY

Jade can be quite valuable. The more transparent, translucent, and deep green, the more valuable it is. There are, however, many imitations made from glass or less valuable stones. Real jade is noticeably cold to the touch and quite heavy—more so than glass or even quartz. Imagine what it would feel like to touch the cold and heavy jade.

FACTS

TYPE: Mineral

MOHS SCALE: 6.5–7

LUSTER:

- Vitreous

CHAROITE

This purple stone was first discovered in the 1940s and was called “Lilac Stone.” It is now named after the Chara River in Siberia, Russia, which is the only region in which charoite has ever been found. As rare as it is, it can be found in large chunks and is rather inexpensive. You can buy a stone for a couple of dollars.

FACTS

TYPE: Metamorphic

MOHS SCALE: 5–6

LUSTER:

- Dull
- Pearly
- Vitreous

ROCK STUDY

Charoite has unique swirling patterns due to the inclusion of other minerals and the way its crystals are formed. Sometimes they almost look like pictures of landscapes, oceans, or objects. Find a purple crayon (or multiple shades of purple), as well as 1–2 other colors, and create a swirling pattern of your own on a piece of paper.

OBSIDIAN

Obsidian is a volcanic glass that is a result of lava cooling quickly from contact with a lake, ocean, or cool air. Obsidian can be made into extremely sharp blades. Even the sharpest metal blade, when viewed under a microscope, has jagged edges, but obsidian remains smooth.

ROCK STUDY

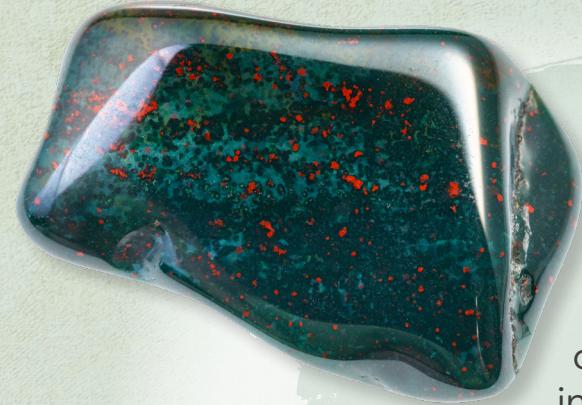

Snowflake obsidian gets its name because of the inclusion of cristobalite crystals that form inside the obsidian, creating a splotchy look. Notice the stark contrast between the black obsidian and white crystals. How many snowflake shapes do you see on the stone?

FACTS

- TYPE: Igneous
- MOHS SCALE: 5–6
- LUSTER:
 - Vitreous

BLOODSTONE

Bloodstone (also called heliotrope) gets its name from the flecks of red in the green opaque stone, due to hematite (iron oxide) inclusions. The name hematite comes from the Greek word for blood. Bloodstone has traditionally been used for jewelry, figurines, and small carvings.

ROCK STUDY

Not all bloodstones have the red inclusions of hematite. Look at this picture with eleven bloodstones. How many of them appear to have the red specks? How many do not? Look at the heliotropes with no red inclusions. Notice the difference in color, from light to dark green. Which do you like best?

FACTS

TYPE: Igneous

MOHS SCALE: 6.5–7

LUSTER:

- Vitreous to waxy

RHODOCHROSITE

The most spectacular rhodochrosites are found in Colorado, ranging from deep red to light pink hues. Because they are relatively soft, they can be difficult to cut, but there are cut stones as large as 60 carats! Most faceted stones, however, are 5 carats or less.

FACTS

TYPE: Mineral

MOHS SCALE: 3.5–4

LUSTER:

- Vitreous
- Pearly

ROCK STUDY

As you compare the photos, notice colors, shapes, patterns, and designs. What similarities do you see between them? What differences do you see? What fruits do they resemble? Which are vitreous? Pearly? Both?

SPESSARTINE GARNET

ROCK STUDY

Have you ever put a strong flashlight behind your hand to watch the front of your hand glow? If you hold the dark reddish spessartine up to the light, the light shines through, making the stone glow orange. How would you put these stones in order from lightest to darkest?

FACTS

TYPE: Mineral

MOHS SCALE: 7–7.5

LUSTER:

- Vitreous

Rare and valuable, spessartine garnets range in color from light mandarin to a deep reddish-orange to brownish and can be found in several countries around the world. The gems are named after the Spessart Mountains in Bavaria, Germany, where they were first found. The rich mandarin colors fetch the highest prices. Violet-red spessartines have been discovered in Colorado and Maine.
